Assignment 9:

Write a C program that includes a user-defined function named setBit with the signature int setBit(int num, int position);. The function should set the bit at the specified position (0-indexed) to 1 and return the modified number.

Source Code:

```
#include<stdio.h>
int setBit(int num, int position) {
   return num | (1 << position);
}
int main() {
   int num, pos, update;
   printf("Enter the num : ");
   scanf("%d",&num);
   printf("Enter the position : ");
   scanf("%d",&pos);
   update = setBit(num,pos);
   printf("The original number = %d",num);
   printf("\nThe modified number = %d",update);
   return 0;
}
```

Output:

```
Enter the num :5

Enter the position :1

The original number = 5
The modified number = 7
Process finished with exit code 0
```

```
Enter the num :13

Enter the position :1

The original number = 13
The modified number = 15
Process finished with exit code 0
```
